(54) **INHIBITOR FOR 20-HETE-YIELDING ENZYME**

(57) The present invention relates to an inhibitor for production of 20-hydroxyeicosatetraenoic acid, comprising, as an effective ingredient, specific hydroxyformamidinium derivatives or pharmaceutically-acceptable salts thereof. The inhibitors according to the present invention are useful as therapeutic agents for kidney dis-

eases, cerebrovascular diseases, or circulatory diseases.

In addition, the present invention also provides novel hydroxyformamidinium derivatives or pharmaceutically-acceptable salts thereof.

EP 1 226 819 A1

## Description

## Technical Field

- 5 [0001] The present invention relates to hydroxyformamidinobenzene derivatives inhibiting a synthase of 20-hydroxy-yeicosatetraenoic acid (20-HETE) biosynthesized from arachidonic acid.

## Background Art

- 10 [0002] Prostaglandins produced by cyclooxygenase and lipoxygenases produced by lipoxygenase have been well known as physiologically active substances synthesized from arachidonic acid. Recently, it has been elucidated that 20-HETE, which is produced from arachidonic acid by the cytochrome P450 family enzymes, functions in various manner *in vivo* (*J. Vascular Research*, vol. 32, p.79 (1995)). It has been reported that 20-HETE induces constriction or dilation of important organs such as the kidneys and the cerebral blood vessels, and causes cell proliferation, and  
 15 it is suggested that 20-HETE plays important physiological roles *in vivo*, and participates in various kidney diseases, cerebrovascular diseases, or circulatory diseases (*J. Vascular Research*, vol. 32, p. 79 (1995); *Am. J. Physiol.*, vol. 277, p. R607 (1999); and the like).

## Disclosure of the Invention

- 20 [0003] An object of the present invention is to provide an inhibitor for production of 20-HETE, which participates in constriction or dilation of microvessels in the important organs such as the kidneys and the cerebral blood vessels, or in causing cell proliferation.  
 [0004] As a result of various studies in order to solve the above problem, the present inventors have found that  
 25 aromatic compounds having a specific substructure unexpectedly possess the inhibitory activity for 20-HETE synthase, to accomplish the present invention.  
 [0005] That is, one mode of the present invention corresponds to an inhibitor of 20-hydroxyeicosatetraenoic acid synthase, comprising, as an effective ingredient, a hydroxyformamidine derivative represented by the general formula  
 (1) as follows:

#### Example 5

##### Synthesis of N-[4-(pyridin-2-ylmethoxy) phenyl]-N'-hydroxyformamidine

[0114] A mixture of 4-(pyridin-2-ylmethoxy) aniline (1.715 g) and ethyl orthoformate (2.613 g) was stirred for 14 hours at 100°C. Subsequently, the excess of the ethyl orthoformate was removed. To a methanol solution (20 ml) of the residue, a 1M methanol solution (10 ml) of hydroxylamine was added, and the mixture was stirred for 2.5 days at room temperature. The solvent was removed and subsequently, to the residue, chloroform was added. Subsequently, it was washed with water and saturated brine. The organic layer was dried over anhydrous magnesium sulfate and the solvent was removed. The obtained residue was purified by recrystallization from ethyl acetate to yield the target compound (Compound 345 in Table 1 described below) (0.524 g) as a colorless powder.

Melting point: 159.5 - 161.0°C

#### Example 6

##### Synthesis of N-[4-(benzylthio)phenyl]-N'-hydroxyformamidine

[0115] A mixture of 4-(benzylthio) aniline (1.18 g) and ethyl orthoformate (1.78 g) was stirred for 12 hours at 100°C. Subsequently, the excess of the ethyl orthoformate was removed. To a methanol solution (20 ml) of the residue, a 1M methanol solution (10 ml) of hydroxylamine was added, and the mixture was stirred for 2.5 days at room temperature. The solvent was removed and subsequently, to the residue, chloroform was added. Subsequently, it was washed with water and saturated brine. The organic layer was dried over anhydrous magnesium sulfate and the solvent was removed. The obtained residue was recrystallized from ethyl acetate to yield the target compound (Compound 441 in Table 1 described below) (0.43 g) as a colorless powder.

Melting point: 166°C

#### Example 7

[0116] The compounds shown in Table 1 described below were obtained by carrying out the similar procedures as those of Production Example 1. The compounds obtained in Production Examples 1 to 6, together with the other compounds are also shown in Table 1.

[0117] The R<sub>f</sub> values in Table 1 corresponds to the R<sub>f</sub> values in the case of development with a mixture of ethyl acetate : hexane (1:2) (no mark) or in the case of development with a mixture of chloroform : methanol (9:1) (marked as \*), employing thin layer chromatography Silica gel 60 F<sub>254</sub>, produced by Merck, or NH-TLC plates, produced by Fuji

## Experimental Example [Inhibitory effect of 20-HETE synthase originated from rat kidney microsome]

[0118] Regarding the compounds listed in Table 1, their inhibitory activity to production of 20-HETE was examined. This examination was carried out based on the method described in J. Pharmacol. Exp. Ther., Vol. 268, pp. 474 (1994).

[0119] The subject compound for this examination was added to a buffer comprising 50mM of 3-morpholinopropanesulfonic acid (pH7.4), 5mM of magnesium chloride and 1mM of ethylenediaminetetraacetic acid (EDTA) disodium salt.

[0120] After that, the rat kidney microsome (microsome fraction prepared from the kidney of a spontaneous hypertension rat (male, 6 weeks of age)) as an enzyme, [5, 6, 8, 9, 11, 12, 14, 15] tritium-arachidonic acid (supplied by Amasham) as a substrate, and NADPH (supplied by Sigma) as a coenzyme were added and reacted for 1.5 hours at 37 °C.

[0121] After the reaction, formic acid was added to stop the reaction, and then acetonitrile (final concentration of 50%) was added and left for 1.5 hours at room temperature.

[0122] The activity of 20-HETE synthase was measured by using a high performance liquid chromatograph having a detector for radioactive substances (supplied by Gilson), and equipped with a C18 reversed phase column (Biocyl C18, supplied by Bio-rad).

[0123] Setting an amount of 20-HETE production to 100% when no subject compound for examination was added, the concentration of the subject compound at which the production of the 20-HETE was inhibited to 50% and the inhibition rate at which 1 $\mu$ M of the subject compound was added are presented together in Table 1.

[0124] Referring to Table 1, it was confirmed that the compounds of the present invention have inhibitory activity for production of 20-HETE.

## Industrial applicability

[0125] The compounds represented by the general formula (1) or the pharmaceutically-acceptable salts thereof according to the present invention are useful as inhibitors for production of 20-HETE. Therefore, they are useful as medicines, and in particular, therapeutic agents for various diseases in human subjects and animals, which 20-HETE is implicated in, such as kidney diseases, cerebrovascular diseases, or circulatory diseases.

[0126] In addition, in the compounds represented by the general formula (1) or the pharmaceutically-acceptable salts thereof, the compounds wherein a non-hydrogen substituent is present at the para position of the hydroxyformamidino moiety on the benzene ring are, in particular, preferable.

[0127] In addition, the compounds represented by the general formula (1) or the pharmaceutically-acceptable salts thereof as recited in Claims 5 or more are novel compounds and useful in themselves, and also, exhibit the excellent effects described above.
